

PSYCHOLOGY 101 · WEEK 1 QUIZ

Psychology 101 — Week 1

Name: _____

Date: _____

How to play: Read each question twice, read every choice, cross out the wrong ones, then put an X in the box next to your answer. Get **6 of 8** right to earn the badge.

1. Psychology is the science of...☐
☐
☐
☐

- A. the brain's cells and the chemicals that pass between them.
- B. the body's organs and how each one does its job.
- C. how people live together in groups, teams, and organizations.
- D. the mind and behavior — what people (and babies) think, feel, and do.

2. Newborns can't answer questions. How do psychologists find out what a newborn knows?☐
☐
☐
☐

- A. By waiting until the child is old enough to describe what it remembers from being a baby.
- B. By scanning the baby's brain with a machine that reads its thoughts directly.
- C. By asking the parents to make their best guess about what the baby is thinking.
- D. By measuring what the baby does — how long it looks, how hard it sucks, how its heart rate changes.

3. In the “Cat in the Hat” study, mothers read the same story aloud every day in the last weeks of pregnancy. After birth, the babies...☐
☐
☐
☐

- A. sucked on a pacifier in the pattern that played the familiar story rather than a new one.
- B. could say a few words from the story by the time they were six months old.
- C. cried whenever they heard the story, because the sound was too familiar.
- D. fell asleep faster whenever any story at all was read to them in a quiet voice.

4. From about what age in the womb does a baby begin to hear?☐
☐
☐
☐

- A. Around 36 weeks, in the last month before birth.
- B. Around 24-25 weeks — about the age of the earliest preemies.
- C. Around 12 weeks, as soon as the ears have formed.
- D. Only at birth, when the ears first fill with air.

5. A newborn's eyes focus best at about 20-30 centimeters (8-12 inches). Why is that distance interesting?

- ☐ A. It's the distance at which the pulse oximeter's red light looks brightest.
- ☐ B. It's exactly the length of a newborn's arm from shoulder to fingertips.
- ☐ C. It's about how far a baby's face is from a parent's face during holding and feeding.
- ☐ D. It's about the distance from a baby to the top of an isolette's clear hood.

6. Psychologist Heidelise Als watched premature babies very closely and showed that...

- ☐ A. preemies grow faster and sleep better in bright, busy rooms with plenty of sound and activity around them.
- ☐ B. preemies should be touched and held as little as possible, including by their own mothers and fathers.
- ☐ C. preemies signal stress through movements and color changes, so NICUs should adjust light, noise, and handling.
- ☐ D. preemies cannot feel any discomfort at all until they reach the date on which they were due to be born.

7. Until the 1980s, many doctors believed newborns didn't really feel pain. What changed their minds?

- ☐ A. Studies measured babies' stress hormones and heart rates during procedures and found big responses.
- ☐ B. Babies began learning to speak at earlier ages, so they could finally describe their pain in their own words.
- ☐ C. Parents were finally allowed to stay inside the NICU overnight, and they reported hearing the babies cry.
- ☐ D. New anesthesia drugs were invented that worked only on newborn babies and had no effect on adults.

8. Why is kangaroo care considered brain care, not just a way to keep a baby warm?

- ☐ A. The warmth of the parent's body directly speeds up the growth of brand-new brain cells in the baby.
- ☐ B. Calm skin-to-skin contact steadies a preemie's stress, sleep, and heart rate while the brain wires itself.
- ☐ C. It keeps the baby awake for longer stretches of time, and brains do most of their growing while awake.
- ☐ D. It replaces the need for the baby to hear any voices or other sounds during its weeks in the NICU.

Score: _____ / 8

Badge earned? YES / NOT YET (need 6)
