

PSYCHOLOGY 101 · RECITATION HOMEWORK

Homework 2: Bonding

Name: _____

Date: _____

Instructions: About 20 minutes. Part A is the heart of it: three experiments, what they measured, what they found. Part B is real fieldwork – tally marks count as data. Total: **21 points**.

Part A — Three experiments

1. Fill in the table. (1 point for what was measured, 1 point for what it showed, per row.) (6 pts)

Experiment	What was measured (what the babies DID)	What it showed
Harlow's cloth mother (1958)		
Ainsworth's strange situation (1969)		
Tronick's still face (1975)		

Part B — Serve and return, tallied

2. Watch a grown-up and a baby or toddler for two minutes (a real one, or a video – 'still face experiment' or any parent-and-baby clip works; a pet and its person is fine too). Make a tally mark every time the little one 'serves' (a look, sound, reach, smile) and another every time the grown-up 'returns' it. Write your two totals, then one sentence about what you noticed. (4 pts)

Part C — Secure or not?

3. Baby R cries when her mother leaves the strange-situation room, runs to her when she comes back, settles in about a minute, then goes back to the blocks. Ainsworth would call this... (1 pt)

☐
☐
☐
☐

- A. secure — the rope is strong and the baby knows it.
- B. insecure — a secure baby wouldn't cry when the mother left.
- C. insecure — a secure baby would keep clinging and not go back to play.
- D. impossible to say without watching the stranger's behavior.

4. Baby S does not look up when his mother leaves, and does not go to her when she returns; he keeps playing with his back to her. Ainsworth found babies like S usually had caregivers who did what? What is the ONE word that matters most in her answer? (2 pts)

Part D — Keeping the rope in a NICU

5. List three things a NICU can do to keep the rope between a preemie and her parents strong — and for each, say what a scientist could MEASURE to prove it works. (3 pts)

Part E — Flashbacks

6. From NICU Tutor: name one thing kangaroo care does for a baby's BODY (not its feelings). (1 pt)

7. From last week's Psychology: what tool did Robert Fantz invent for finding out what babies prefer? (1 pt)

Part F — Think like a doctor

8. A mother says to you on rounds: “I feel like a visitor, not a mom. She’s in a box with wires, and I’m not allowed to do anything.” Her baby is on CPAP in an isolette, stable. Using today’s class, what would you say, and what would you change about her day? (3 pts)

HOME LAB (optional, not graded): The still face, grown-up version

You need: a willing grown-up with a good poker face and a timer (NOT a baby — that’s a scientists-only lab)

1. Talk with the grown-up normally for 30 seconds while they respond as usual.
2. On your signal, they go still-faced for 30 seconds: no expression, no nodding, no words. You keep talking.
3. Notice what you do. Louder? A joke? Waving? Giving up? Notice how it feels.
4. Swap roles: you go still-faced while they talk. Watch what THEY do.
5. Write three things each of you did to restart the game.
