

PSYCHOLOGY 101 · WEEK 2 QUIZ

Psychology 101 — Week 2

Name: _____

Date: _____

How to play: Read each question twice, read every choice, cross out the wrong ones, then put an X in the box next to your answer. Get **6 of 8** right to earn the badge.

1. What is attachment?☐

A. The built-in bond that makes a baby seek closeness to a caregiver and explore from that safe base.

☐

B. The wiring of a baby's brain at more than a million connections every second.

☐

C. The reflex that makes a newborn grip a finger placed in its palm.

☐

D. The habit a baby forms of loving whoever brings the milk, learned over the first year.

2. In Harlow's experiment, baby monkeys could choose a wire mother with milk or a cloth mother with none. What did they do?☐

A. Ignored both mothers and huddled together with the other baby monkeys instead.

☐

B. Clung to the wire mother most of the day, because that is where the food was.

☐

C. Clung to the cloth mother most of the day and went to the wire one only to eat.

☐

D. Split their time equally between the two, feeding from one and sleeping on the other.

3. In Ainsworth's strange situation, a baby called "secure" does what when the mother comes back?☐

A. Clings to her and cries for the rest of the session without settling.

☐

B. Goes to her, calms down within a minute, and returns to playing.

☐

C. Ignores her and keeps playing as if she had never left the room.

☐

D. Goes to the stranger instead, because the stranger stayed in the room.

4. In the still-face experiment, what did babies do when their mother's face went blank?

- ☐ A. Kept playing happily on their own, because babies that young don't really notice faces or expressions.
- ☐ B. Tried smiles and sounds to restart the game, then fussed and looked away – and recovered when she returned.
- ☐ C. Cried immediately and could not be comforted for the rest of the day, even after the game resumed.
- ☐ D. Fell asleep within a minute or two, because nothing interesting was happening in front of them any more.

5. According to Ainsworth, what builds a secure attachment?

- ☐ A. A caregiver who avoids responding too much, so the baby learns independence.
- ☐ B. Feeding the baby on an exact schedule so it learns to trust the clock.
- ☐ C. A caregiver who responds to the baby's signals reliably – not perfectly, reliably.
- ☐ D. A caregiver who never leaves the baby alone, even for a minute.

6. Why were parents kept OUT of premature-baby nurseries for much of the twentieth century?

- ☐ A. Parents were thought to be too upset by the machines to be useful at the bedside.
- ☐ B. Hospitals charged parents for each visit, and most families could not afford it.
- ☐ C. Doctors feared parents would carry in germs – a kind idea with a cost nobody had measured.
- ☐ D. Doctors believed newborns could not tell one person from another until six months old.

7. What did the big 2021 study of immediate kangaroo care find?

- ☐ A. Starting skin-to-skin right after birth cut deaths of small babies by about a quarter.
- ☐ B. Kangaroo care worked in rich countries but not in poorer hospitals.
- ☐ C. Skin-to-skin made babies warmer but made no difference to how many survived.
- ☐ D. Babies held skin-to-skin gained weight, but their mothers became more anxious.

8. Why does bonding count as medicine in a NICU, not just niceness?

- ☐ A. It replaces the isolette for most babies, so hospitals can save money on machines and electricity.
- ☐ B. It lets nurses leave the bedside for longer, because a parent can watch the monitor for them instead.
- ☐ C. It makes the baby cry much less, which keeps the unit quieter and calmer for all the other babies.
- ☐ D. It measurably steadies heart rate, breathing, and sleep, helps babies grow, and lowers parents' stress.

Score: _____ / 8

Badge earned? YES / NOT YET (need 6)
